## Emil Malak Wrote!

### **An Important Warning About the Coronavirus Vaccine**

I am NOT a scientist or an economist, but I do conduct a lot of research. I speak with many experts in various fields, and I love acquiring knowledge. The opinions expressed in this article are my own. They are straight to the point, hard hitting and presented in a take no prisoners' manner. I am NOT an anti-vaxxer, nor do I subscribe to any crazy conspiracy theories. On the contrary, I am a proponent of vaccines so long as they are safe. Vaccines have played an important part in the safety of the public and have eradicated the threat of diseases like polio and the measles, and we need to continue research to develop new vaccines in the future.

**No political angle: only opinions based on scientific information**

### **Herd Immunity and Vaccines are Dead**

A day after a University of Hong Kong research team confirmed a case of a patient that was re-infected with COVID-19, four months after originally testing positive with the coronavirus, Belgium and the Netherlands announced cases of reinfection in their countries. In each case the patients became re-infected months after they originally came down with and beat the virus. Additionally, in an August 24<sup>th</sup> video statement, the head of Russia's Tyva region in southern Siberia, Sholban Kara-Ool, announced that he has been infected with coronavirus for a second time -- three months after he was first hospitalized with a confirmed case of COVID-19.

## **A Possible and Simple Medical Explanation**

Antibody-dependent enhancement (ADE) is a phenomenon in which a virus binds to NON-neutralizing antibodies that do not kill the virus. Instead, they act as a vehicle carrying the virus to the cells which infect the host. ADE is a serious concern in the development of a vaccine and antibody therapy.

If memory B-cells are disabled and unable to create neutralizing antibodies as has been the case with over 80% of first-time infected patients, the virus will bind to the recognizing (non-neutralizing) antibodies and be transported throughout the body, attacking and killing the T-cells. The immune system becomes very weak and unable to mount a strong attack via T-cells against the virus. When a patient is re-infected or gets vaccinated, the non-neutralizing (recognizing) antibodies will enable the new infection to cause more serious damage to the body than it did the first time. The person's weakened immune system may not be able to properly fight the virus potentially leading to permanent organ damage or in some cases death. This is my understanding and I suspect it will become more widely known as we see vaccines move more into the spotlight in the coming weeks and months as clinical trials continue to unfold.

Today covid-19-2.0 is not the same coronavirus that started in Wuhan/China(Covid-19-1.0). The deep gene sequencing of today's Covid-19-2.0 is a single 614g mutation of the original Wuhan coronavirus.

## **Manslaughter**

Are the proposed vaccines by Oxford University, Astra Zeneca, Moderna and others a forced collaboration by desperate governments to fast track scientific data? Vaccines take years to develop. The data obtained from volunteers of clinical trials needs at least one year of confirmation after vaccination before being able to arrive at any positive conclusions. In my opinion, rushing a vaccine like this through such a shortened process and eliminating the necessary time to confirm the vaccine's safety and efficacy is an act of manslaughter. It will lead to unnecessary illness and death.

**Scientific facts are facts and should never be manipulated under any circumstances. Unfortunately, some have manipulated data related to the coronavirus in order to achieve their misguided objectives.**

### **Is the Coronavirus Dying out?**

Contrary to what many people believe, the coronavirus is not dying out. So far, a single mutation has made COVID-19 even more contagious. Recent breakouts in Malaysia and parts of Europe are showing to be as much as 5% to 10% more contagious. This is not a time for wishful thinking, it is a time to follow the fact-based data.

My fear is the possibility that a future single mutation of the spike protein could make the virus five to ten times more deadly. Are we about to see a repeat of the Spanish Flu this fall? We need to learn and to adjust our lives so we can live with COVID-19-2.0 for years to come. I have been [advocating](#) for continuous testing of everyone as the only solution to get and keep the virus under control.

I encourage you to read my previous articles and see for yourselves how the things I have been predicting since February are one by one coming to fruition.
