Timely Topics

I am NOT a scientist or an economist, but I do conduct a lot of research. I speak with many experts in various fields, and I love acquiring knowledge. The opinions expressed in this article are my own. They are straight to the point, hard hitting and presented in a take no prisoners' manner. I am NOT an anti-vaxxer, nor do I subscribe to any crazy conspiracy theories. On the contrary, I am a proponent of vaccines so long as they are safe. Vaccines have played an important part in the safety of the public and have eradicated the threat of diseases like polio and the measles, and we need to continue research to develop new vaccines in the future.

No political angle: only opinions based on scientific information

Top Scientists Have Become Coronavirus Quacks

Once again, Dr. Fauci has changed his tune on coronavirus vaccines. Dr. Anthony Fauci, Director of the National Institute of Allergy and Infectious Diseases (NIAID), part of the National Institutes of Health (NIH), has tarnished the reputation of a once prestigious institution. Speaking about the prospects for an effective COVID-19 vaccine, Dr. Fauci recently said 50% to 60% would be acceptable and the probability of a vaccine that is 98% effective is “not great.”

Will anyone in their right mind take a vaccine that we are told could be 50% to 60% effective? This is not a guessing game. How sure are they about the vaccine's effectiveness months after being vaccinated? It may be twenty five percent or less effective after six months.

<https://www.msn.com/en-xl/news/other/chance-of-coronavirus-vaccine-being-highly-effective-not-great/ar-BB17LBrT>

Why are top scientists promoting the non-effectiveness of a vaccine? Are they conflicted or are they trying to please desperate politicians? They need to stay true to science which is backed up by data and stop trying to politicize it.

Fauci is suddenly sounding the alarm and jumping off the sinking vaccine ship in order to not be the fall guy. Instead he trying to turn attention to the CEO of Moderna whose shares are now valued at a billion dollars. I would not be surprised to see Moderna's CEO one day admit that he was pressured into exaggerating and spinning the prospects of an effective vaccine.

What about Safety?

Once again, safety is sidelined or at least up in the air. We know that approximately 25% of recovered COVID-19 patients do not develop neutralizing antibodies. The virus is able to somehow disable the ability of the memory B cells to produce neutralizing antibodies. The danger is when a recovered patient becomes re-infected with the coronavirus more than 6 months later and there are no neutralizing antibodies to defend against the virus. They are more likely to suffer organ damage and possibly die. We have to wait at least one year after vaccination before we have sufficient data to support the effectiveness and safety of a vaccine.

I have been warning since February governments and health institutes that forcing coronavirus vaccines prematurely on the public is tantamount to manslaughter. President Trump and other politicians have been completely misinformed by "quack scientists" about a safe and effective vaccine solution that does not exist.

Billions of dollars in advances for vaccines have been flushed down the toilet

As the powerful pharmaceutical companies compete to develop an unsafe and less effective coronavirus vaccine, problems regarding the disabling of antibody production continue to impede any so-called vaccine breakthrough.

Meanwhile, Moderna has pre-sold millions of doses of the future vaccine for between \$19.50 to \$37.00 per dose.

AstraZeneca has sold 30 million advance vaccine doses to Britain and another 400 million doses have been sold in advance to France, Germany, Italy and the Netherlands, and signed a sub-licensing agreement with Serum Institute of India for a billion doses.

In addition to its Moderna investment and a deal with AstraZeneca, the United States has a signed supply deal with Pfizer.

For years, scientists have been trying unsuccessfully to develop a vaccine for MERS, SARS and HIV but have failed for the same reasons regarding antibodies that exists with COVID-19. Science is the same, but what has changed that now they are so sure a coronavirus vaccine will finally work?

I am all for safe vaccines like we have for polio, smallpox, and measles. Those vaccines do not disable antibody production in more than 25% of people vaccinated.

An influenza vaccine presents two possible quandaries:

First, we need to know if someone getting the seasonal flu vaccine will actually increase their chances of getting COVID-19. The possibility exists that a flu shot could trip the respiratory viral mechanism in the lungs making someone more susceptible to getting infected with the coronavirus.

Greg. G Wolff, an Epidemiologist with the Armed Forces Health Surveillance Branch wrote about this in a recent paper. "At least as important is the unanswered question whether the severity of COVID-19 is affected by influenza vaccination (e.g. if infection is enhanced, is there more viral load, is the immune response altered?)."

With all this in mind and after a discussion with my wife, neither her nor I nor our two children will be getting the flu vaccine this year. The risk is much too high.

Second, and perhaps more alarming will take place this winter which is rapidly approaching. People with cold symptoms or a cough will be taken to hospitals and it may be difficult to differentiate between a seasonal cold, influenza or the coronavirus.

Remdesivir is rendered useless

Remdesivir is an antiviral medication administered intravenously. It's been touted by some as a miracle therapeutic drug but it cannot save lives and is not effective against a new strain of COVID-19-2.0. The coronavirus has changed through mutation and has become an immunological disease. Even after the virus is dead, the person's immune system continues to cause inflammation. It is like an avalanche that grows as ice and snow ferociously roll down the mountain and becomes impossible to stop. The same thing happens in the body when an inflammatory cascade begins, and so far, neither Remdesivir nor any other therapeutic solution has been able to stop that cascade. A totally new approach is needed; scientists need to think outside the box. The Remdesivir solution has been proven ineffective and another quack scientist has flushed away hundreds of millions of dollars.

Time for a flat consumption tax, 20% across the board and eliminate the IRS

It is time for taxation to be simplified and the IRS to be eliminated. This could be accomplished by replacing the current complex tax code with a simple 20% consumption tax. All goods sold would be assessed a 20% federal tax, paid, and transferred to the Department of the Treasury at the time of the transaction. It would eliminate the need to complete complicated IRS forms and cut billions of dollars in government expense instantly. The IRS as we know it would cease to exist and would be replaced with a streamlined tax and revenue department to oversee the tax collection.

The same concept could be applied to corporate taxes, having corporations pay 15% on all purchased goods and a 15% capital gains tax. The new system will do away with tax loopholes that allow companies like Amazon to make billions and pay zero in taxes. No more claiming losses on a tax form. The taxpayer will pay their tax immediately as they go, and the government will receive its money in its bank account immediately without delay.

Nine of the fifty states do not assess a state income tax, including the 2nd and 3rd most populous in the nation, Texas, and Florida. Each of the nine states generates sufficient revenue from sales tax (consumption tax) without putting a heavy tax burden on their residents. In my proposal, even

paying a 20% federal sales tax and a 6% or 7% state sales tax, taxpayers will come out ahead. It's better for the taxpayer to pay a combined 27% tax on the goods they purchase than the current system where they pay 27% or higher on their total income in addition to the 7%, they pay their state for their consumption.

Study after study has shown that a flat tax system would greatly increase tax revenue and lessen the burden on taxpayers. Individuals would keep more of their own money, millions more jobs would be created, and the economy would expand even further. The coronavirus will take second or third place in people's minds if there is the promise of fair tax reform, and the President will cruise to victory. The majority of hardworking voters have one main voting priority, the money in their pockets; everything else takes second place.

Trace the blame to New York's Governor Cuomo for much of the outbreak throughout the U.S.; COVID-19-2.0

The current Wuhan virus is not the same strain that first broke out in China and throughout the world earlier this year. Researchers have confirmed that the strain of the virus that was spreading at the height of the pandemic in Europe weeks after the original outbreak, was a mutated version of the original; a COVID-19-2.0. The virus was mutating at an alarming rate. Just one mutation of the genetic sequence within the spike protein changed the position of the "614 G" aspartic acid (contains an amino acid and a carboxylic acid) to an "amino acid glycine."

That single change within the spike protein has created a new COVID-19-2.0, far more contagious and deadly than the original. Some experts believe a recovered COVID-19 patient could become defenseless against the new COVID-19-2.0. Unfortunately, the new strain is believed to have come to the United States from Italy and Europe via New York City. New York's Governor Cuomo did not restrict or advise against travel out of his state and allowed the new strain to spread rampantly. The governor is very good at pointing fingers and criticizing the president and his administration. He should check his own record first and remember how he ordered infected elderly patients back to their nursing homes causing thousands of unnecessary deaths.

Today, we are seeing a much more contagious spread of the new, speedier, and more contagious COVID-19-2.0 throughout the states. The contagion of the new strain is believed to be 5 to 9 times higher than the earlier coronavirus. Even the World Health Organization (WHO) recently confirmed the coronavirus will not be going away soon, which means it will not be dying out in the host like other viruses, as we originally predicted it would. The mutated "614G" illustrates how much we are on thin ice right now and how close we are getting to a Spanish Flu style second wave. The properties of the new strain should sound the alarm for scientists. To keep this virus in check, people need to change their behavior and embrace mask wearing, social distancing and avoidance of large gatherings. We need to implement continuous rapid testing. This strain is far worse than the first. We need to take serious measures, or we could be facing something even more deadly with the next mutation.

Topic

Dendritic cells and CD4/vaccine

Recently, it was reported that a group of eleven out of twelve Bavarians previously infected with the novel coronavirus by a business associate visiting from China four months ago showed no presence of antibodies, neither neutralizing nor recognizing antibodies. Some researchers believe the lack of antibodies present is due to the possibility that COVID-19 may adversely affect the ability of dendritic cells (antigen presenting cells) and T helper cells, also called CD4 cells to form antibodies.

The dendritic cells process antigen material and present it on the cell surface to the T cells of the immune system. CD4 cells are a type of T cell that help suppress or regulate immune responses. They are called helper cells because one of their main roles is to send signals to other types of immune cells that destroy infectious particles. If CD4 cells become depleted, the body will be susceptible to a wide range of infections that it would otherwise have been able to fight. In the simplest of terms, the dendritic and CD4 cells work together to train recognizing antibodies to convert to neutralizing antibodies to fight off infection.

The aforementioned case of eleven patients presenting hardly any antibodies would be at increased risk the next time they are infected with a coronavirus such as COVID-19, COVID-20, SARS, or MERS. The result could be damaged organs, or potentially death.

Warning: a safe vaccine is impossible; current testing is flawed and incomplete

I have two questions for all the scientists that believe a successful vaccine will be developed.

1. How can any measure of efficacy of a vaccine be measured before at least six months to one year has elapsed since administration of the final dose?

Moderna has just begun a Phase 3 clinical trial of its proposed vaccine with 30,000 volunteers. Antibodies, whether recognizing or neutralizing antibodies will always present immediately following administration of a vaccine; however, they will tend to disappear within three to six months. Scientific studies have clearly shown a significant lack of antibodies within three to four months following infection. Would it not be tantamount to manslaughter to administer a vaccine knowing full well that within months

there will not be sufficient antibodies to protect the patient and they may even be left at an increased risk for reinfection?

Pharmaceutical giant Johnson & Johnson is claiming initial success in their quest for a COVID-19 vaccine, declaring a “robust immune response demonstrated by neutralizing antibodies.” Once again, I will repeat that a robust immune response of neutralizing antibodies is normal immediately after being vaccinated. The real test is what happens in 3 months, 6 months and 1 year later as the study Germany found.

AstraZeneca Pharmaceutical, Britain’s most valuable listed company, revealed that they have pre-sale deals with various countries for two billion doses for a vaccine developed in partnership with Oxford university. The results of the Phase I/II trial published on the 20th of July 2020 in the scientific journal, The Lancet, indicate no early safety concerns and induces strong immune responses in both parts of the immune system. The vaccine provoked a T cell response within 14 days of vaccination (white blood cells that can attack cells infected with the SARS-CoV-2 virus), and an antibody response within 28 days (antibodies are able to neutralize the virus so that it cannot infect cells when initially contracted). During the study, participants who received the vaccine had detectable neutralizing antibodies. As I keep repeating, that is completely normal and expected. The real question that everyone continues to avoid is not about the immediate presence of antibodies, but how many will disappear within 6 to 12 months of being vaccinated.

<https://leadership.ng/2020/07/22/new-study-reveals-oxford-coronavirus-vaccine-produces-strong-immune-response/>

2. What will happen when a volunteer is exposed to COVID-19 six or months after receiving the vaccine and he or she does not have the necessary antibodies to fight off infection?

Dr. Anthony Fauci singled out Moderna’s vaccine

In a statement on May 22, about Moderna’s announcement on the progress of their vaccine, Dr. Anthony Fauci said: "The vaccine induced what we call neutralizing antibodies, as opposed to just binding antibodies, and neutralizing antibodies are antibodies that actually can block the virus...."

In contrast to Fauci's assertions, several published papers written by German scientists have confirmed that the amount of antibodies present in more than 70% of recovered patients was either drastically reduced or not even present, three to six months after recovery.

Recently, Dr. Fauci doubled down on his support for Moderna's vaccine saying he is "not particularly concerned," about the safety risk of a potential coronavirus vaccine by Moderna, despite the fact that it uses new technology to fight the virus.

Moderna's vaccine utilizes ribonucleic acid or mRNA to provide an immune response to fight the virus. To date, there has never been a successful vaccine that attempted to use mRNA technology, nor has Moderna ever brought a successful vaccine to the market.

You cannot put people at risk for potential permanent organ damage or possibly death because you think it is safe. It is much worse now that we have confirmation the coronavirus adversely affects the ability of the dendritic and C4A cells. Pharmaceutical trials are first and foremost about safety, and in the case of a coronavirus vaccine that safety cannot be properly assured unless sufficient antibodies to fight the virus are still present one year after infection.

I recommend that the first people to take this vaccine should be Dr Fauci and all the Moderna executives since they are the ones that are supporting this vaccine scam.

<https://www.cnbc.com/2020/07/27/dr-anthony-fauci-isnt-particularly-concerned-about-safety-of-moderna-coronavirus-vaccine.html>

Russia's Gamaleya Institute

Russia is planning to approve for public use the world's first COVID-19 vaccine by August 10th. It was developed by Moscow based Gamaleya Institute using a platform first developed for Ebola. Like Moderna, they are pushing it through at a blistering pace despite concerns about its safety and effectiveness due to lack of data in an effort to beat the rest of the world.

<https://nypost.com/2020/07/29/russia-seeks-to-approve-covid-19-vaccine-by-mid-august-report/>

Science should never be politicized

In previous articles I have written explained why I believe a safe and effective vaccine will not be possible. In my opinion the current race for a vaccine among several pharmaceutical companies is nothing more than a way for them to exploit the situation for their financial gains. We have seen several companies receive hundreds of millions of dollars in government grants and see large gains in their stock prices like we have seen happen with the shares of Moderna and others. It seems to me various interest groups and many within the scientific community have misinformed the administration on the viability of developing a safe vaccine, which I have stated repeatedly will be impossible. I warn these giant publicly traded companies, they could find themselves losing quite a bit of their market cap once participants realize the companies knew all along the neutralizing and other antibodies would disappear three to six months after vaccination.

Politicians are desperate for a vaccine solution and scientists have taken advantage of that and misled them about the true prospects of a vaccine. Science is science and interfering in the scientific process will backfire. I expect that once the November election is over the pharmaceutical companies will be conceding their vaccines did not work despite their best efforts.

It is very disconcerting to see that executives of pharmaceutical companies working on vaccines have sold so many shares of their stock. More than a billion dollars in stock has been sold in recent weeks. Moderna execs alone have accounted for hundreds of millions of dollars in stock sales with the CEO, selling nearly \$5 million during the first 16 days of July. Moderna also more than tripled its planned executive stock sales just days after announcing positive results of its vaccine. If a vaccine has not even been developed yet, why are these executives selling so many shares now? If they were to develop a vaccine their stock price would soar much higher than where it is now. Why not wait a few months and make much, much more money? Perhaps they are afraid the vaccine will fail, and their share value will plummet?

An article in the Jerusalem Post described how Moderna executives' compensation plans allow them to cash out of their stock by only reaching development milestones, even for drugs that often do not get approved or sold. "This may be their one shot at making a boatload of money if the vaccine doesn't work out," said Jesse Fried, a Harvard Law School professor who wrote a book about executive compensation, adding

that Moderna's chiefs have a powerful motivation to "keep the stock price up."

Moderna executives unloading so many shares before their phase 3 clinical trials began is a telling sign they do not have confidence in their vaccine. President Trump should ask Moderna to return the \$483 million they received from the government. The President was lied to and was given bad, biased advice.

<https://www.cbsnews.com/news/moderna-executives-increased-stock-sales-after-coronavirus-vaccine-trial-data/>

<https://www.jpost.com/international/moderna-cmo-sells-shares-as-final-vaccine-trials-begin-raising-concerns-637166>

Recently, the head of the World Health Organization (WHO) Director-General Dr Tedros Adhanom Ghebreyesus conceded that an effective vaccine may never be a reality. At an August 3rd media briefing the Director General said, "although *we all hope to have a number of effective vaccines*" there is still *"no silver bullet at the moment and there might never be."*

<https://www.rt.com/news/496970-covid-silver-bullet-never/>

Second Wave

Has a second and much more contagious wave of COVID-19 already begun in the U.S., Europe, and other countries? We had all hoped the virus would have died down by this point as many other viruses have in the past; but that does not seem to be the case so far with this virus. The hope and prayer we all have is that this virus will not mutate like the Spanish Flu did when it exploded into a second and more deadly wave.

Therapeutic solutions should be the focus

Coronavirus will be with us for quite a while. With no possibility of developing a vaccine researchers and pharmaceutical companies should shift their focus to finding a therapeutic solution. A drug is needed that can stop the onset of the inflammatory cascade that ultimately kills many of the

patients that succumb to the virus. It is not enough to just disable the cytokine storm; the process is much more complex.

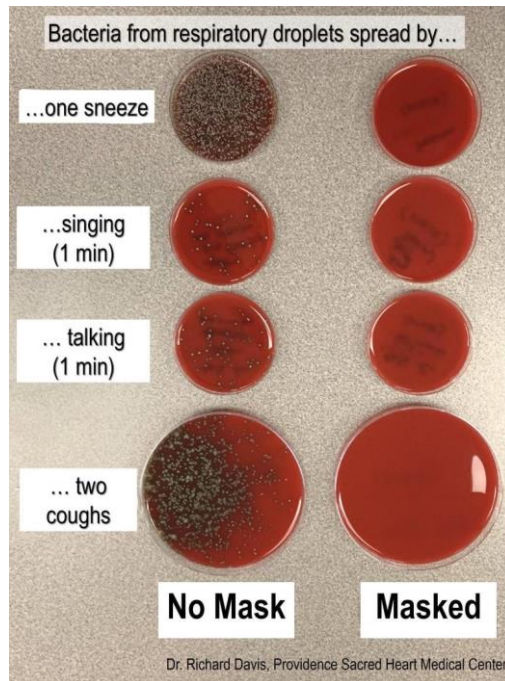

Rapid Testing

Why is it that we have the ability to implement rapid testing, but people still have to wait 5 days or more to get their test results? Rapid testing must be implemented. Previously, I laid out a [plan](#) to do just that by converting ambulances into mobile testing sites and have them visible on every corner. We cannot delay this, and we should have it in place before election day.

In the meantime, safety protocols should adjust according to the progress of the virus. For now, we should legislate mask wearing, encourage regular handwashing, and continue social distancing while indoors. In addition to ramping up rapid testing, we need to have isolation and contact tracing. The administration's task force has failed to provide a national rapid testing program. Such a program is needed to be in place before the November election. I also stand by my previous [recommendation](#) that we involve the military to assist with the widespread testing needed to stop the spread of the virus.

Legislate mask wearing

Mask wearing is another issue that has sadly become highly politicized since the outbreak of the novel coronavirus. Mandating the wearing of a mask is not about infringing on one's liberty, it is about keeping those around you safe. The facts could not be clearer. They say a picture is worth a thousand words, but in this case a picture is worth a million words. The picture below shows the difference in the amount of bacteria in respiratory droplets a person releases into the air when wearing a mask versus not wearing a mask. The time for excuses is over. Mask wearing should be mandatory.

Source: Dr. Richard Davis, Providence Sacred Heart

Blood plasma

Some doctors have been treating COVID-19 patients with plasma from the blood of recovered patients. As I have previously laid out the case, there is no guarantee of herd immunity for the coronavirus as was originally thought by Sweden and the U.K. If the production of neutralizing antibodies is somehow disabled by the virus there cannot be herd immunity. This makes use of blood plasma in the treatment of COVID-19 futile. Science cannot be compromised or manipulated.

Topic

Cut all economic ties with the new evil empire, China

Europe, the United States, and the Muslim and Christian world should come together and act now. As an Egyptian born Christian, I appeal to Muslims; stop buying Chinese made products. China currently has more than one million Uighur Muslims illegally incarcerated in so-called "education camps." Additionally, they are forcing the sterilization of Muslim women to eliminate future Islamic generations and end the existence of Muslims in China.

My criticism of the Chinese government is aimed exclusively at the regime, not the People. In no way is this a reflection on my feelings towards the Chinese people. Chinese immigrants are hardworking, family oriented, industrious people that contribute greatly to society. I have many Chinese friends, and I have great respect and admiration for them. you rarely find a Chinese immigrant dependent on government assistance.

History repeats itself

Has the world forgotten the lessons learned from World War II? In his ambition to conquer the world Hitler imprisoned Jews in concentration camps and invaded countries. China has similar ambitions; they are intent on conquering the world economically. China has been buying up western assets and investing heavily in Africa. Additionally, they are flexing their military muscles in front of the world with their actions in the South China Sea.

China is overdue for a military confrontation. Soon, they will be on the brink of war in either the South China Sea or in Iran's Strait of Hormuz. Iranian mullahs (Muslim clerics learned in Islamic theology and sacred Islamic law) have handed over the Island of Kish to China in exchange for cash and other commodities. Those mullahs have betrayed their faith. How can they stand idly by and not condemn the actions of the Chinese regime against the Uighurs, their fellow Muslims?

Revive western industry in the wake of the coronavirus

So far, President Trump and Boris Johnson have been the only world leaders to publicly denounce China's inhumane treatment of Uighur Muslims and the repressive new Hong Kong security law. Details of the law's 66 articles were kept secret from the public until after it was passed. The new law takes away many freedoms long enjoyed by the citizens of Hong Kong and criminalizes all forms of government protests, making them punishable with a maximum sentence of life in prison.

It is time for Europe, Canada, and Australia to follow suit and begin a total withdrawal of economic relations with China. The west must rebuild its industries in the wake of the coronavirus and secure their own economic futures and that of future generations. China will never truly be anyone's

ally; they will only exploit and steal. People everywhere should boycott anything that is made in China.

It should start by manufacturing all pharmaceuticals and medical supplies at home. It is an issue of national security that countries no longer rely on China for these lifesaving necessities.

In an effort to do just that, President Trump engaged the former film giant, Kodak to make pharmaceutical drug ingredients here at home. In a press conference announcing the deal, President Trump said, "We will bring back our jobs and we will make America the world's premier medical manufacturer and supplier."

<https://www.cnn.com/2020/07/28/kodak-soars-another-40percent-after-trump-announces-deal-to-manufacture-generic-drug-ingredients.html>
